ISE 575 EE 675b CSCI 575b **Topics in Engineering Approaches to Music Cognition**

Musical Prosody and Interpretation

Spring 2010

Daniel J. Epstein Department of Industrial and Systems Engineering
University of Southern California Viterbi School of Engineering

Instructor:
Elaine Chew
echew@usc.edu
GER-241, (213) 8.212.414

Tuesdays, 10am-1pm
PHE 223

www-scf.usc.edu/~ise575/d

Pre-requisites:
Graduate standing in engineering or by instructor's consent.
Programming experience (C++ or Java) and/or formal music knowledge.

This course explores the role of musical prosody in conveying diverse interpretations in musical performance. Performers manipulate musical parameters such as tempo, loudness, and articulation, so as to focus attention and facilitate parsing of musical features, and to create emotional affect. The class covers computational techniques for measuring prosodic cues such as timing and loudness (and time permitting, timbre) in music, the resulting accents and phrases, and how they map to perceived prominence and grouping. The class emphasizes learning by example, and learning by doing. The expected work includes reading of contemporary scientific literature on the topic, writing, presentation, discussion, and a final project.

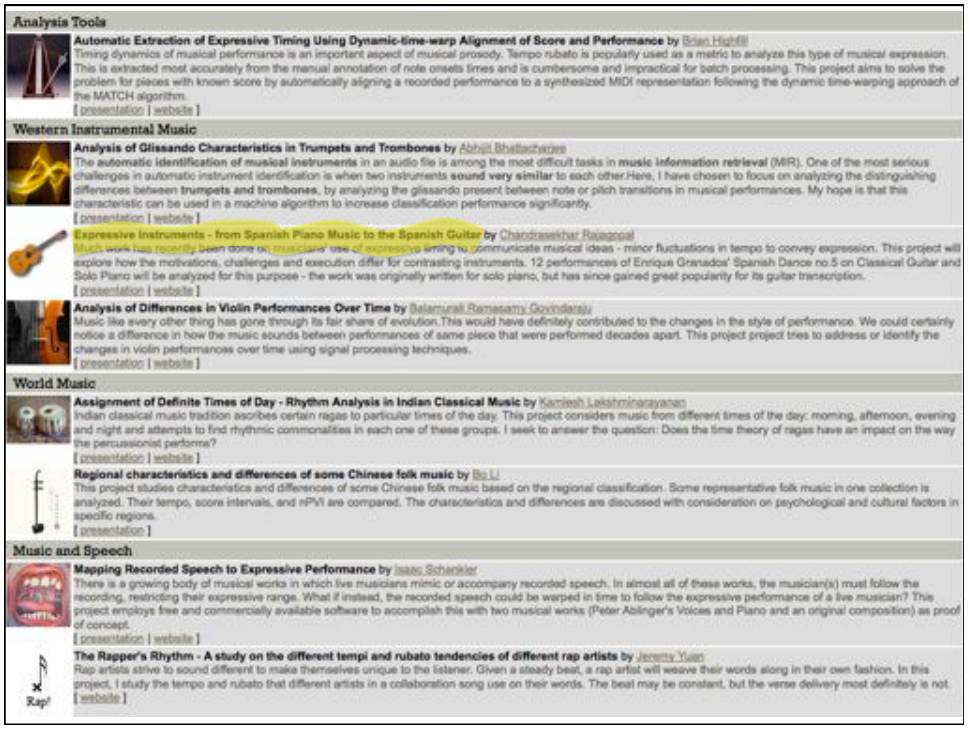
ISE575b CSCI575b EE675b Topics in Engineering Approaches to Music Cognition

Musical Prosody and Interpretation

Spring 2010

Daniel J. Epstein Department of Industrial and Systems Engineering
University of Southern California Andrew and Erna Viterbi School of Engineering

Introduction	
Week 1	Introduction to the course, and to concepts of beat, tempo, and loudness.
(Jan 12)	Listening examples include: Kreisler, Bach's Unaccompanied Violin Sonata, Glenn Gould's recordings of Bach's Goldberg Variations, Brahms' Hungarian Dances.
Week 2	Palmer, C., & Hutchins, S. (2006). What is musical prosody? In B. H. Ross (Ed.), Psychology of Learning and Motivation, 46: 245-278. [PDF] reports: [bhattacharjee, lakshminarayanan, rajagopal, schankler]
(Jan 19)	Homework 1B: Bring a piece of music that has variations in tempo or loudness to share with the class. Download and install QMUL's Sonic Visualiser.
Rhythm in Music and Speech	
Week 3	Patel, A.D., Iversen, J.R., & Rosenberg, J.C. (2006). Comparing the rhythm and melody of speech and music: The case of British English and French. Journal of the Acoustical Society of America, 119:3034-3047. [PDF] presentation: [balajee] reports: [bhattacharjee, lakshminarayanan, rajagopal, schankler]
(Jan 26)	Iversen, J.R., Patel, A.D., & Ohgushi, K. (2008). Perception of rhythmic grouping depends on auditory experience. Journal of the Acoustical Society of America, 124: 2263-2271. [PDF] presentation: [yuan] reports: [bhattacharjee, highfill]
	Patel, A.D. (2006). Musical rhythm, linguistic rhythm, and human evolution. Music Perception, 24:99-104. [PDF] presentation: [rajagopal] reports: [rajagopal]
(Jan 28)	Special Event: Attend the following talk by Aniruddh Patel to take place at 3:30pm in Doheny 240 - *Rhythm in Speech and Music*. Announcement: [PDF]
Beat and Tempo: Tracking and Analysis	
Week 4	Dixon, S. (2001). Automatic Extraction of Tempo and Beat from Expressive Performances. Journal of New Music Research, 30(1):39-58. [PDF] presentation: [bhattacharjee] reports: [bhattacharjee, rajagopal, ramasamy govindaraju, schankler]
(Feb 2)	Download Dixon's BeatRoot software (requires Java 1.5 or higher). Beat tracking examples.
	Dixon, S. & Widmer, G. MATCH: A Music Alignment Tool Chest. In Proceedings of the 6th Intl Conf on Music Information Retrieval, London, UK, 492-497. [PDF] presentation: [lakshminarayanan] reports: [bhattacharjee, highfill, rajagopal]
	Download Dixon's MATCH software (Java, any platform), or the Sonic Visualiser MATCH Vamp plugin.
Week 5	Timmers, R., Ashley, R, Desain, P, and Heijink, H. (2000). The influence of musical context on tempo rubato. Journal of New Music Research 29(2):131-158 [HTML]
(Feb 9)	Cammuri, A., Mazzarino, B., Ricchetti, M., Timmers, R., and Volpe, G. (2004). Multimodal Analysis of Expressive Gesture in Music and Dance Performances. In Gesture-Based Communication in Human-Computer Interaction, Springer Lecture Notes in Computer Science 2915. Read the Introduction (p.20-22), Section 4 (p.30-37) [PDF]
	Timmers, R. (2005). Predicting the similarity between expressive performances of music from measurements of tempo and dynamics. Journal of the Acoustical Society of America, 117(1): 391-399 [PDF] presentation: [schankler]
Tempo and Loudness: Visualization	
Week 6	Langner J. & Goebl W. (2003). Visualizing Expressive Performance in Tempo-Loudness Space. Computer Music Journal, 27(4): 69-83. [PDF] presentation: [yeh]
(Feb 16)	Goebl, W., Pampalk, E. & Widmer, G. (2004). "Exploring Expressive Performance Trajectories: Six Famous Pianists Play Chopin Pieces." In Proceedings of the 8th International Conference on Music Perception and Cognition. [PDF] presentation: [highfill]
Week 7	Grachten, M., Goebl, W., Flossmann, S., Widmer, W. (2009). Phase-plane Representation and Visualization of Gestural Structure in Expressive Timing. Journal of New Music Research, 38(2): 183-195. [PDF] presentation: [ ]
(Feb 23)	Sapp, C. S. (2007). Comparative Analysis of Multiple Musical Performances. In Proceedings of the 8th International Conference on Music Information Retrieval. [PDF]



Analysis Tools
Automatic Extraction of Expressive Timing Using Dynamic-time-warp Alignment of Score and Performance by Brian Highfill
Timing dynamics of musical performance is an important aspect of musical prosody. Tempo rubato is popularly used as a metric to analyze this type of musical expression. This is extracted most accurately from the manual annotation of note onsets times and is cumbersome and impractical for batch processing. This project aims to solve the problem for pieces with known score by automatically aligning a recorded performance to a synthesized MIDI representation following the dynamic time-warping approach of the MATCH algorithm.
[presentation | website]
Western Instrumental Music
Analysis of Glissando Characteristics in Trumpets and Trombones by Abhijit Bhattacharjee
The automatic identification of musical instruments in an audio file is among the most difficult tasks in music information retrieval (MIR). One of the most serious challenges in automatic instrument identification is when two instruments sound very similar to each other.Here, I have chosen to focus on analyzing the distinguishing differences between trumpets and trombones, by analyzing the glissando present between note or pitch transitions in musical performances. My hope is that this characteristic can be used in a machine algorithm to increase classification performance significantly.
[presentation | website]
Expressive Instruments - from Spanish Piano Music to the Spanish Guitar by Chandrasekhar Rajagopal
Much work has recently been done on musicians' use of expressive timing to communicate musical ideas - minor fluctuations in tempo to convey expression. This project will explore how the motivations, challenges and execution differ for contrasting instruments. 12 performances of Enrique Granados' Spanish Dance no.5 on Classical Guitar and Solo Piano will be analyzed for this purpose - the work was originally written for solo piano, but has since gained great popularity for its guitar transcription.
[presentation | website]
Analysis of Differences in Violin Performances Over Time by Balamurali Ramasamy Govindaraju
Music like every other thing has gone through its fair share of evolution.This would have definitely contributed to the changes in the style of performance. We could certainly notice a difference in how the music sounds between performances of same piece that were performed decades apart. This project project tries to address or identify the changes in violin performances over time using signal processing techniques.
[presentation | website]
World Music
Assignment of Definite Times of Day - Rhythm Analysis in Indian Classical Music by Kamlesh Lakshminarayanan
Indian classical music tradition ascribes certain ragas to particular times of the day. This project considers music from different times of the day: morning, afternoon, evening and night and attempts to find rhythmic commonalities in each one of these groups. I seek to answer the question: Does the time theory of ragas have an impact on the way the percussionist performs?
[presentation | website]
Regional characteristics and differences of some Chinese folk music by Bo Li
This project studies characteristics and differences of some Chinese folk music based on the regional classification. Some representative folk music in one collection is analyzed. Their tempo, score intervals, and nPVI are compared. The characteristics and differences are discussed with consideration on psychological and cultural factors in specific regions.
[presentation]
Music and Speech
Mapping Recorded Speech to Expressive Performance by Isaac Schankler
There is a growing body of musical works in which live musicians mimic or accompany recorded speech. In almost all of these works, the musician(s) must follow the recording, restricting their expressive range. What if instead, the recorded speech could be warped in time to follow the expressive performance of a live musician? This project employs free and commercially available software to accomplish this with two musical works (Peter Ablinger's Voices and Piano and an original composition) as proof of concept.
[presentation | website]
The Rapper's Rhythm - A study on the different tempi and rubato tendencies of different rap artists by Jeremy Yuan
Rap artists strive to sound different to make themselves unique to the listener. Given a steady beat, a rap artist will weave their words along in their own fashion. In this project, I study the tempo and rubato that different artists in a collaboration song use on their words. The beat may be constant, but the verse delivery most definitely is not.
