

Cognitive Wireless Communications -A Solution for Efficient Multiple Networks Coexistence

Wenhui Xiong, Jun Wang & Wanbin Tang

National Key Laboratory of Science and Technology on
Communications

University of Electronic Science and Technology of China

March 28, 2010

National Key Laboratory of Science and Technology
on Communications

Outlines

- Multiple Networks Coexistence: Opportunities and Challenges
- Cognitive Wireless Communications
 - Components
 - Key Technologies
- Dynamic Spectrum Sharing Network (DySNet): A developing prototype for Cognitive Wireless Communication system

Multiple Networks Coexistence: Opportunities and Challenges

Mobile Telephone

- 1990s, 1G/2G
- Voice and SMS only

Mobile Internet

- 2000s, 2G/3G
- Voice, SMS, MMS, email, Web,

Mobile Multimedia

- 2010s, 3G/4G
- Voice, SMS, MMS, email, Web, TV, VoD.....

Mobile ?

- 2020s
- *wireless in everything*
- **Ubiquitous** service..

More and more wireless services arise in recent years.

2G 3G IMT-A

- Problems: Multiple networks coexistence incurs resource scarcity.
- Opportunities: resource can be shared among networks to improve efficiency.

National Key Laboratory of Science and Technology on
Communications

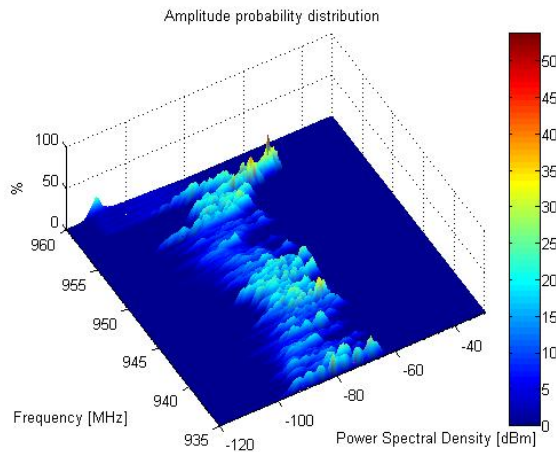

Multiple Networks Coexistence: Opportunities and Challenges

Multiple Networks Coexistence: Opportunities and Challenges (Cont.)

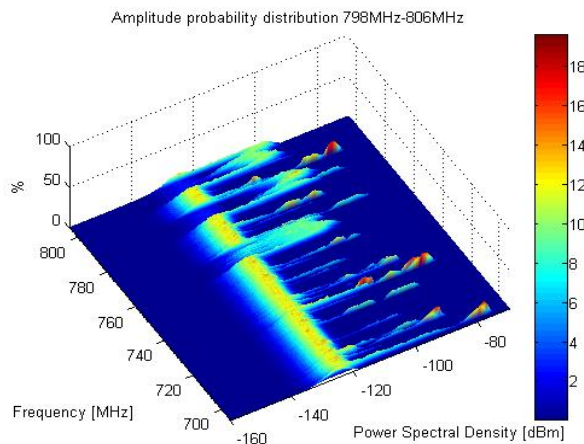

■ Opportunities Analysis

GSM: 955MHz-960MHz (24hours)

IS-95: 869MHz-881MHz (24hours)

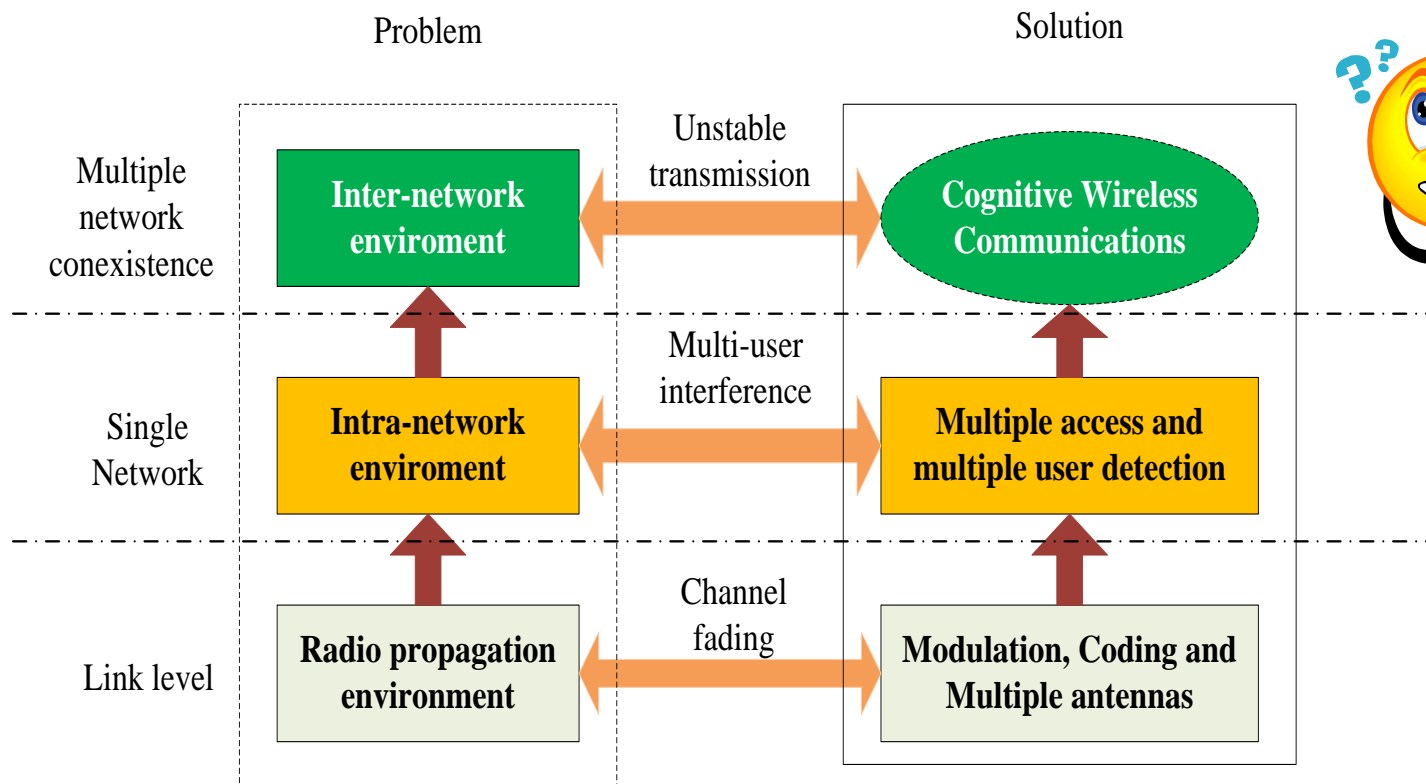

- There exist great opportunities to share resource among networks.
- To utilize the potential opportunities, it is necessary to meet the requirements of primary networks.

Multiple Networks Coexistence: Opportunities and Challenges (Cont.)

- Cognitive Wireless Communications is an efficient solution for multiple networks coexistence scenarios.

Multiple Networks Coexistence: Opportunities and Challenges (Cont.)

- There exists paradox of “**transmission opportunities**” and “**transmission interruption**” for resource sharing under multiple networks coexistence scenarios.

■ **Transmission**

Opportunities: A new network can provide wireless services by dynamically sharing resource with the existing networks to improve the utilization efficiency of resource.

■ **Transmission Interruption:**

A network can be interrupted by the existing networks due to their reclaiming resource.

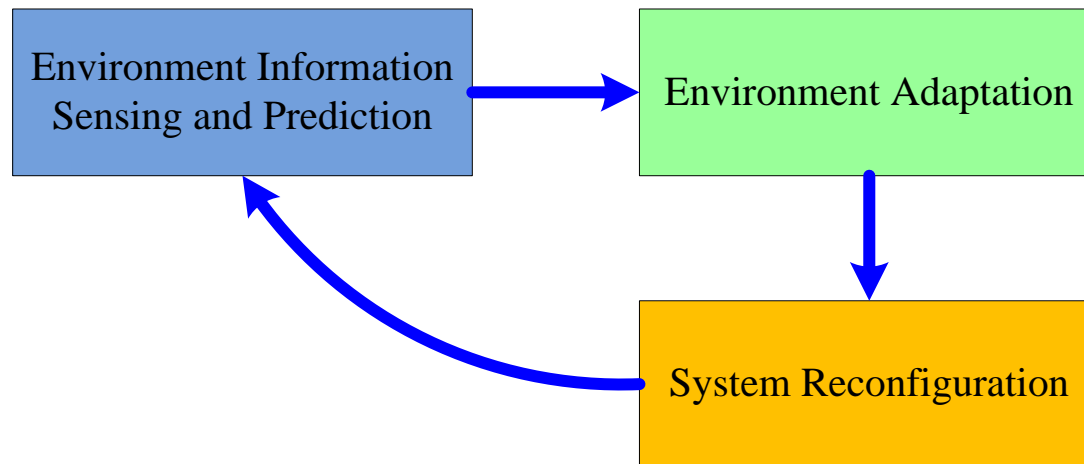

Outlines

- Multiple Networks Coexistence: Opportunities and Challenges
- ☞ *Cognitive Wireless Communications*
 - *Components*
 - *Key Technologies*
- Dynamic Spectrum Sharing Network (DySNet): A developing prototype

Cognitive Wireless Communications

- The Cognitive Wireless Communication System intelligently find and utilize existing available resources to provide services.
- Fundamental Characteristics
 - Environment Sensing and Prediction
 - Environment Adaptation
 - System Reconfiguration

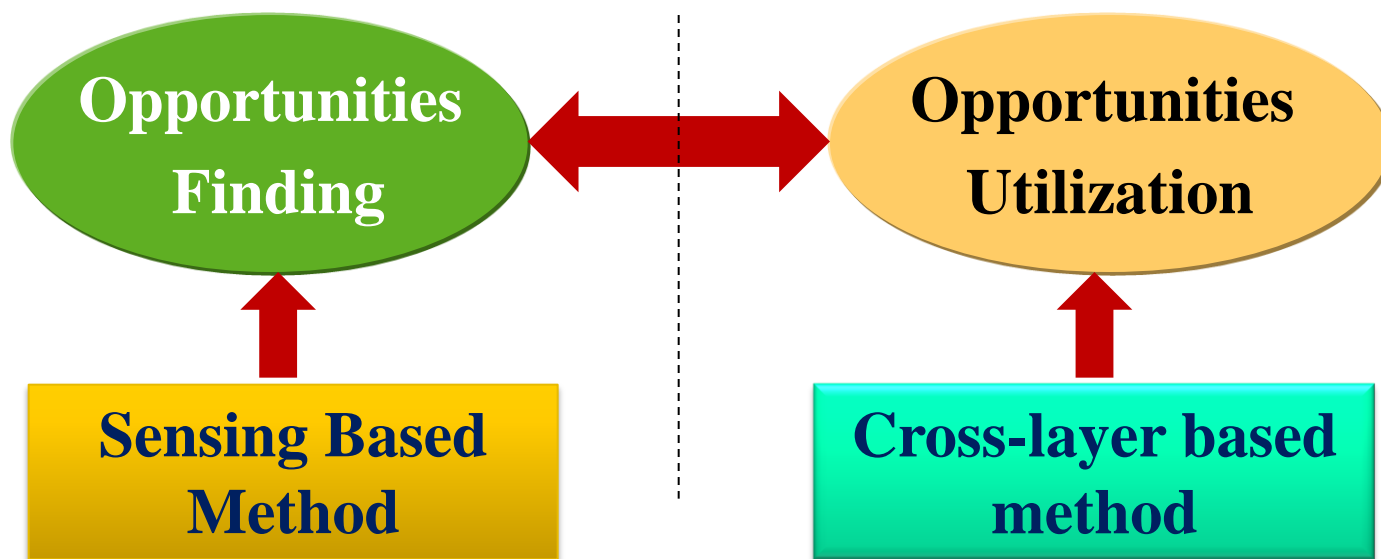

Cognitive Wireless Communications: Components

■ System Components

- **Opportunities Finding**: find the available resource independently or cooperatively
- **Opportunities Utilization**: efficiently use the resource to provide wireless service

Opportunities Finding: Sensing Based Method

Low SNR

- Low received SNR at the cognitive receiver due to channel shadow and fading;
- IEEE 802.22 requires to achieve 90% detection at 10% false alarm rate when the SNR is as low as -20dB.

Speed

- Sense the environment as quickly as possible to;
- Monitor the primary network's activity and vacate the spectrum as fast as possible when the primary network reactivates
- IEEE 802.22 requires the sensing period less than 200ms.

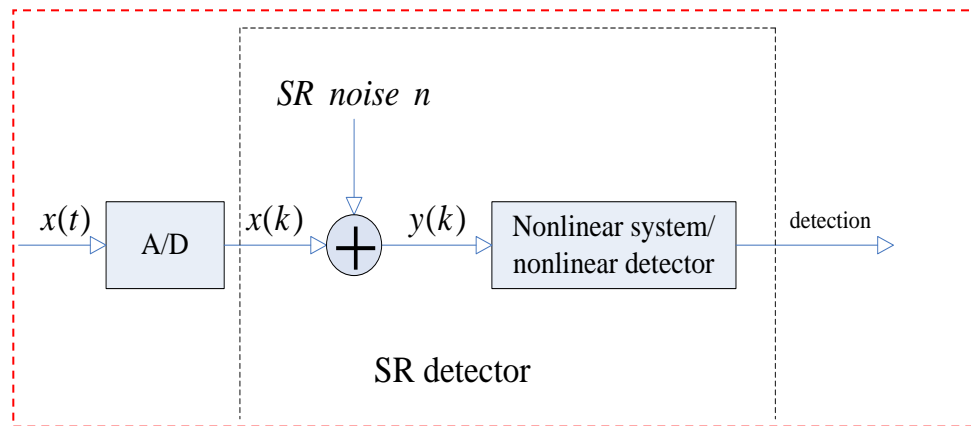

Sensing: Stochastic Resonance Based Sensing

■ Basic principle

- The output SNR can be enhanced when proper noise is added into the *nonlinear* system;
- In the field of signal detection, the SR effect has been studied to improve the signal detectability

■ System model

Stochastic Resonance Based Sensing: Local Sensing

Results

Sensing performance can be significantly improved!

National Key Laboratory of Science and Technology on Communications

Opportunities Utilization: A Cross layer based method

■ Challenges of Opportunities utilization

- It possible to sense several channels;
- Transmission rate and collision determines the throughput;
- The time-varying nature of the radio and network environment poses a complicated task for adaptive access and transmission techniques

The solution to above problems asks for cross-layer design between physical layer and upper layer.

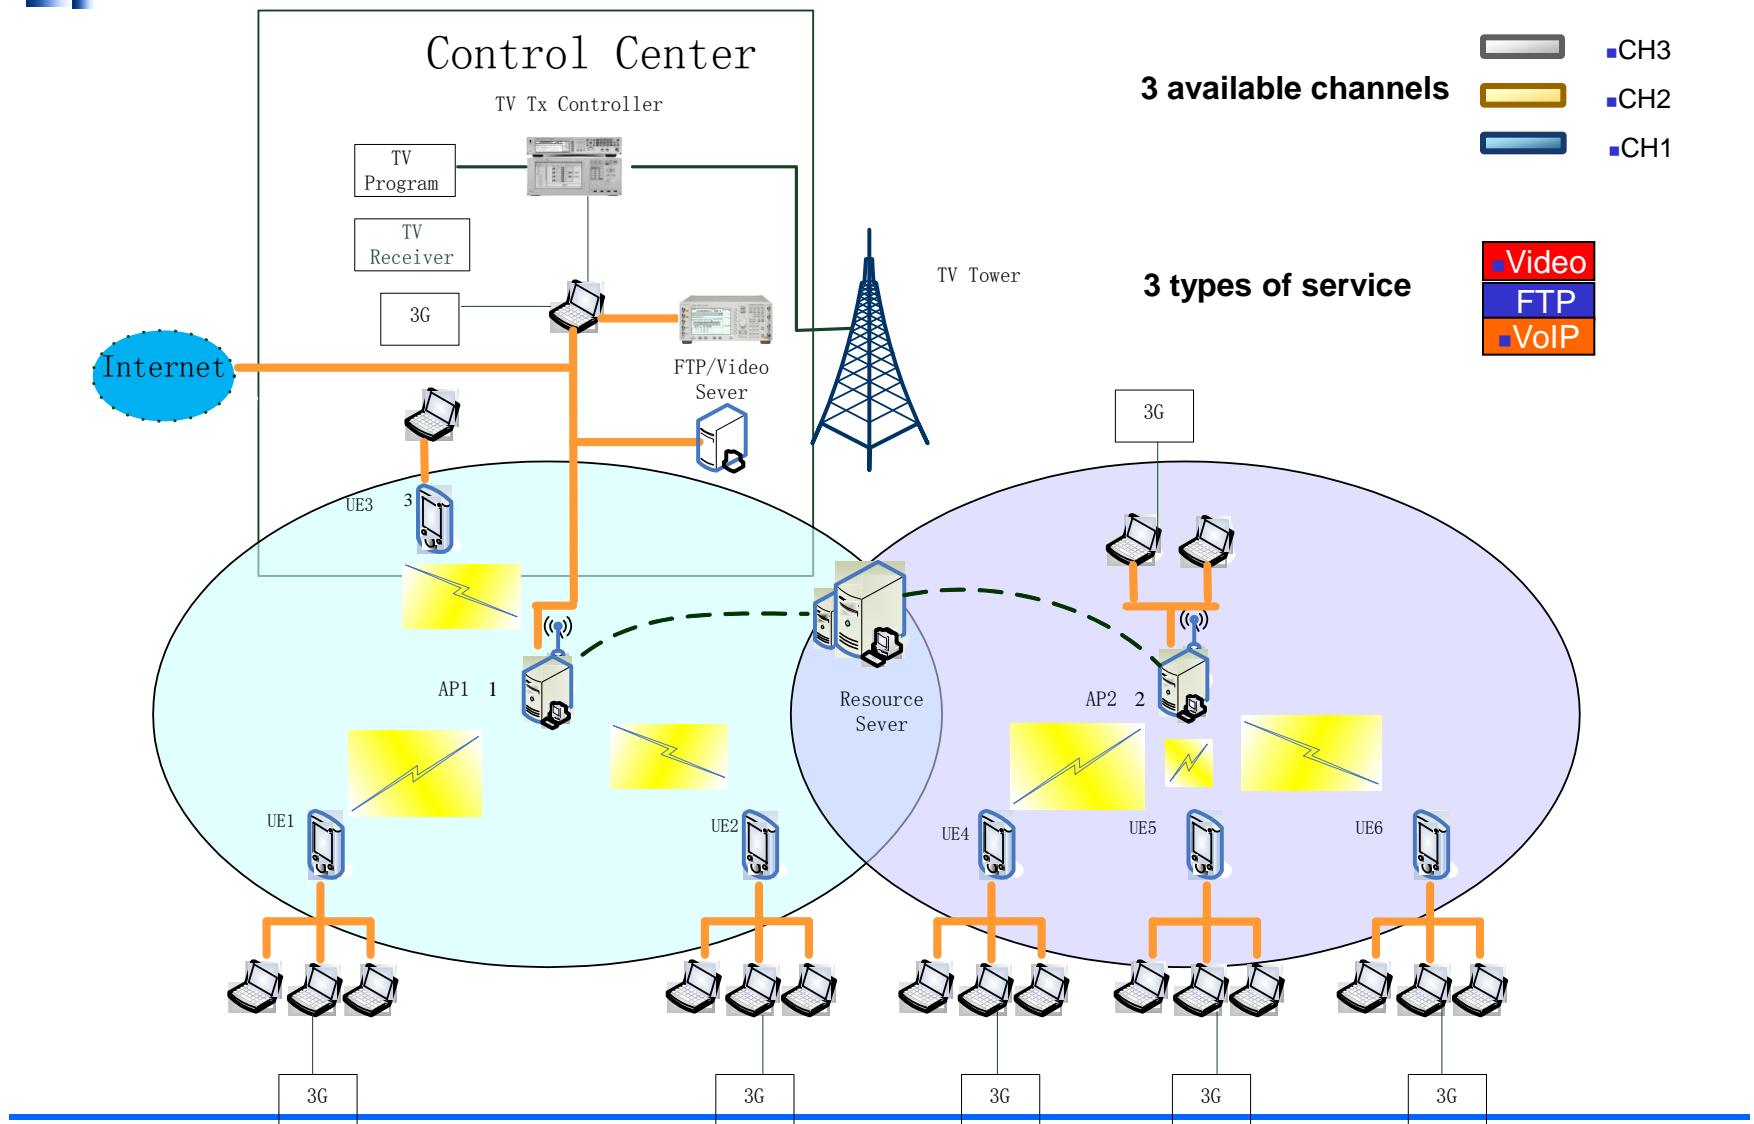

Outlines

- Multiple Networks Coexistence: Opportunities and Challenges
- Cognitive Wireless Communications
 - Components
 - Key Technologies

☞ *Dynamic Spectrum Sharing Network (DySNet): A developing prototype*

DysNet: a developing prototype

DysNet: a developing prototype

- **Operation: Turn off the TV transmission on CH1,CH2 & CH3**

DysNet: Dynamic Access

- Dynamically Provides services to CRUs as the TV transmission are turned off
 - Step 1: 1 unused TV channel;
 - Step 2: increase the no. of unused channel to be 2;
 - Step3: turn off TV transmission on all 3 channels
 - As the no. of CRUs increases, the peak data rate increases

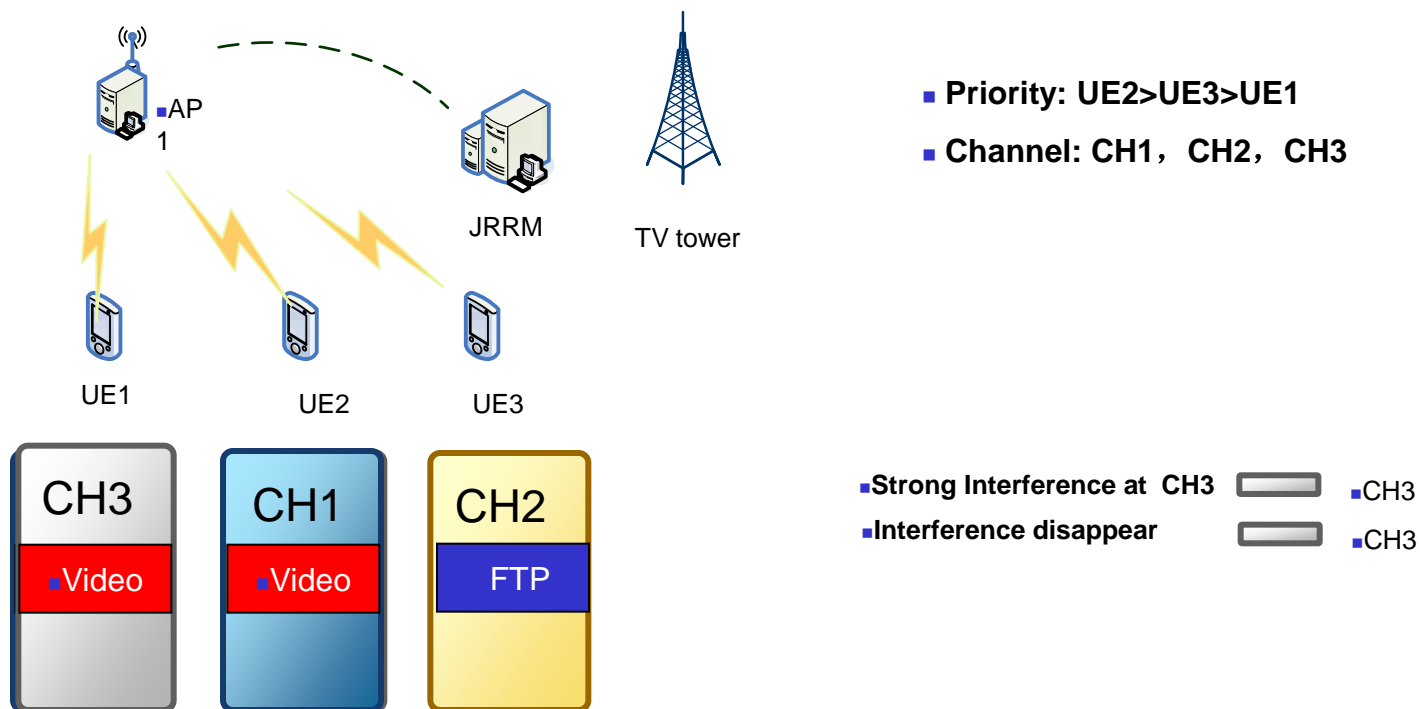

- 1. CH1 unused  ■ CH1
- 2. CH1, CH2 unused  ■ CH1
 ■ CH2
- 3. CH1, CH2, CH3 unused  ■ CH1
 ■ CH2
 ■ CH3

DysNet: Resource Management

- Provide Prioritized service to CRUs
 - Turn off low priority users' transmission to provide service for high priority users
 - Resume service for low priority users when interference disappears

Summary

- New services demand more & more spectrum resources;
- Spectrum is a scare resource;
- Technical Challenges to make the cognitive wireless network work:
 - Spectrum sensing—fast and reliably sense the radio environment;
 - Spectrum utilization—efficiently use the available resource

Thanks !
