Technology Manager

Why Biofuels: Energy Security and Diversity

Line at Gas Station in Maryland
(1979) US News and World Reports
Cause: Iranian Revolution (loss of imported oil)

Line at Gas Station in New Jersey
(2012) Christian Science Monitor
Cause: Hurricane Sandy (loss of electric power)

Transportation Infrastructure “Inelasticity”

New Passenger Cars Trenc

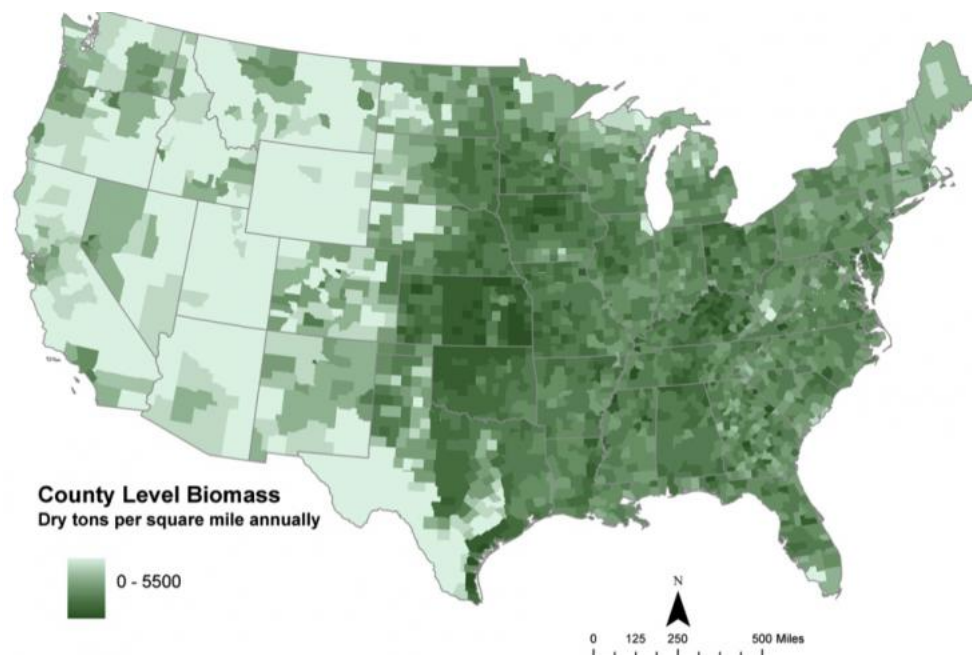

- Number of cars constant (~132,000,000)
- 6.3% rate of fleet turnover per year
- 12 years to change over 50% of fleet; 30+ years for whole fleet

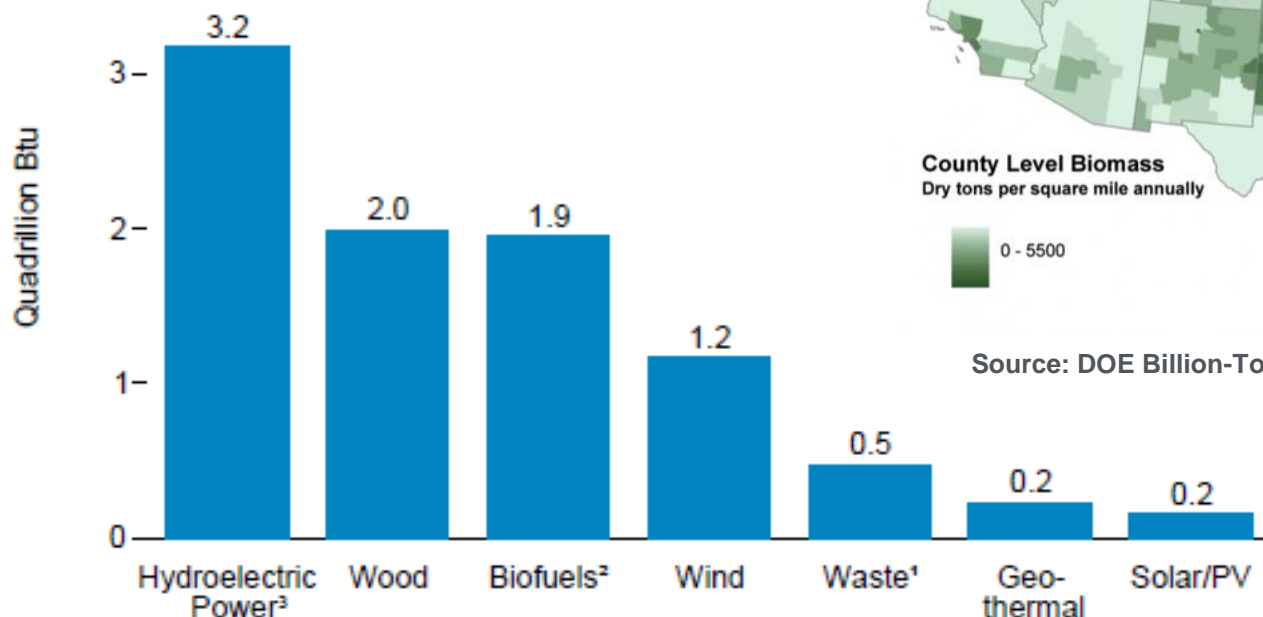

Biomass: A Strategic Clean Energy Resource

One Billion Tons of Biomass Sustainably Harvested Per Year

- Agricultural residues
- Woody biomass
- Energy crops

Source: DOE Billion-Ton Update, 2011

Annual U.S. Renewable Energy Consumption by Source

Source: EIA Annual Energy Review, 2011

Biomass is the **largest** renewable energy source consumed in the United States

Cellulosics: Improving the Environmental Benefits

Water Consumption of Transportation Fuel

	Net Water consumed	Key Variability Factors
Corn ethanol	10-324 L/L ethanol	Regional differences in irrigation
Switchgrass ethanol	2-10 L/L ethanol	Fuel production technology
Gasoline (US conventional crude)	3-7 L/L gasoline	Age of oil well, production technology and degree of recycling
Gasoline (Canadian oil sands)	3-6 L/L gasoline	Geological formation, production technology

Cellulosic Ethanol R&D Accomplishment

In September 2012, scientists at DOE's National Laboratories successfully demonstrated feedstock and conversion processes resulting in production of cellulosic ethanol at a price of \$2.15 or less per gallon.

Biochemical Conversion of Corn Stover: A Decade of Improvements

Source: NREL

Production Cost Improvements: (2001 = \$9.16; 2012 = \$2.15)

2001 = \$1.25/gal 2012 = \$0.34/gal	2001 = \$0.49/gal 2012 = \$0.27/gal	2001 = \$1.37/gal 2012 = \$0.27/gal	2001 = \$4.05/gal 2012 = \$0.39/gal	2001 = \$0.60/gal 2012 = \$0.15/gal	2001 = \$1.90/gal 2012 = \$0.51/gal (Balance of Plant)

Energy Efficiency & Renewable Energy

First Commercial Cellulosic Ethanol Production in US

Ineos Bio's Indian River Bioenergy Center, Vero Beach, FL

Source: Ineos Bio Website

THE WALL STREET JOURNAL.

© 2008 Dow Jones & Company. All Rights Reserved

The news was a milestone for the renewable fuels ... If INEOS Bio can sustain production at the Florida plant, it would offer the promise of a new industry producing fuel out of everything from grass to garbage.

(Ryan Tracy, July 31, 2013)

U.S. Commercial Scale* IBR's Based on Cellulosic Feedstocks

	Ground Broke	Target Product	Location	DOE Role
DuPont	Q4, 2012	Cellulosic ethanol	Nevada, Iowa	R&D
POET-DSM	Q1, 2012	Cellulosic ethanol	Emmetsburg, Iowa	R&D, IBR
Abengoa	Q4, 2011	Cellulosic ethanol	Hugoton, Kansas	IBR
KiOR	Q2, 2011	Cellulosic gasoline, diesel and jet	Columbus, Mississippi	none
Ineos-Bio	Q1, 2011	Cellulosic ethanol	Vero Beach, Florida	R&D, IBR

* "Commercial-scale" defined by expected profitability and not nameplate capacity

Replacing the Whole Barrel

Greater focus needed on RDD&D for a range of technologies to displace the *entire* barrel of petroleum crude

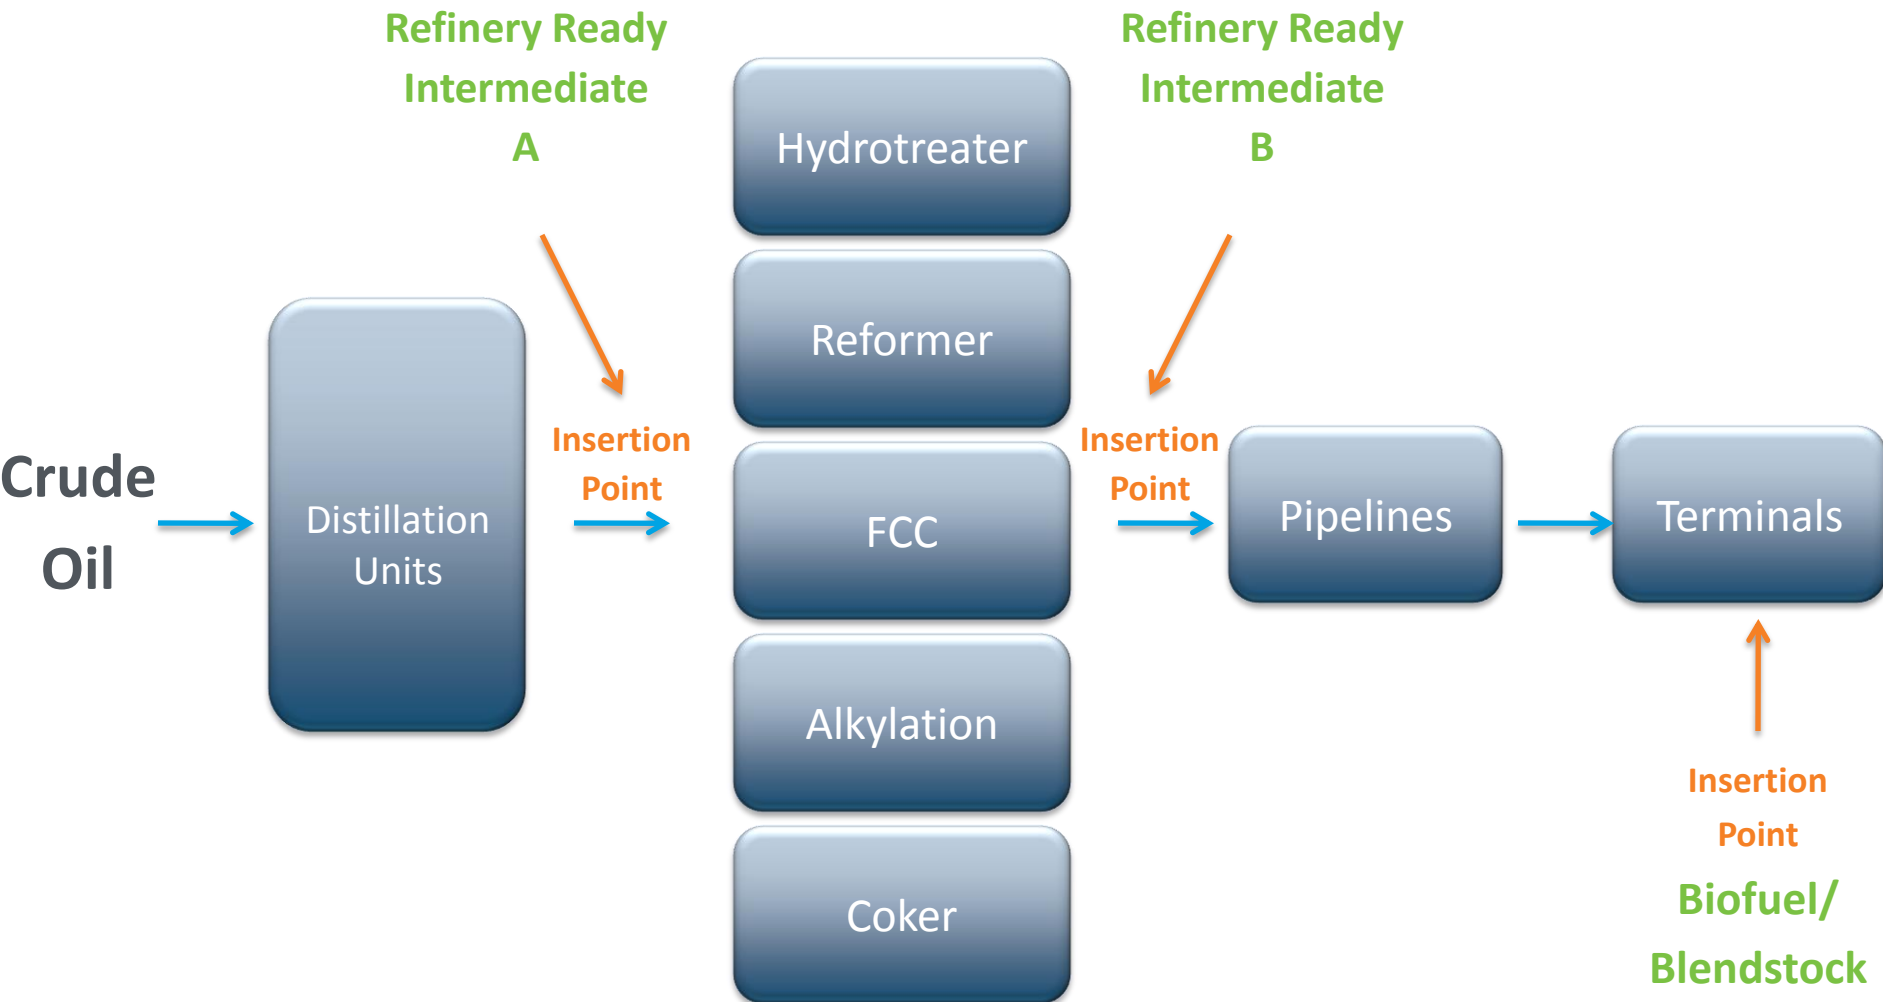

- Ethanol can only displace the portion of the barrel that is made into gasoline.
- Reducing our dependence on oil also requires replacing diesel, jet fuel, heavy distillates, and a range of other chemicals and products that are currently derived from crude oil.

Products Made from a Barrel of Crude Oil (Gallons)

Adapting to Refinery Infrastructure: Save on CAPEX

Adapted from the National Advanced Biofuels Consortium Website

Hydrocarbon Strategy and Implications

	Crude Oil (>80C:1O)	Biomass (1C:1O)
Elemental Composition of Feedstock (weight %)	C = 83 - 87% H = 10 - 14% N = 0.1 - 2% O = 0.05 - 1.5%	C = 44 - 51% H = 5.5 - 6.7% N = 0.12 - 0.6% O = 41 - 50 %
Elemental Composition of Ethanol Product (C ₂ H ₆ O)	C = 52% H = 13% O = 35%	C = 52% H = 13% O = 35%
Elemental Composition of Hydrocarbon Product (50% C ₈ H ₁₈) (50% C ₁₂ H ₂₃)	C = 85.3% H = 14.7% N = 0% O = 0%	C = 85.3% H = 14.7% N = 0% O = 0%

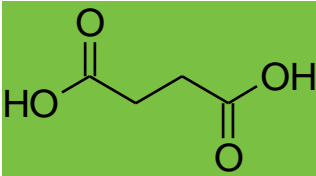

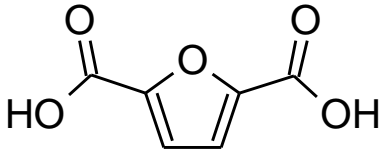

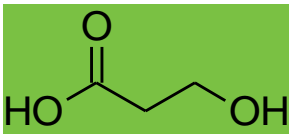

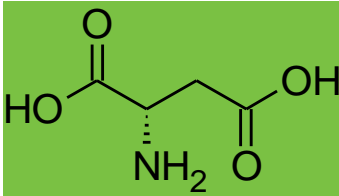

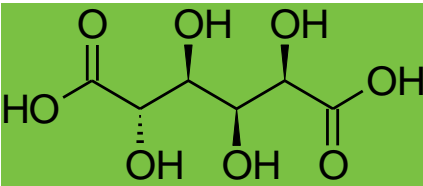

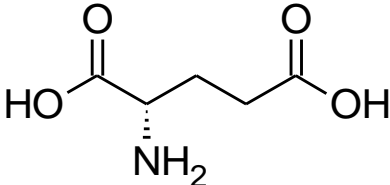

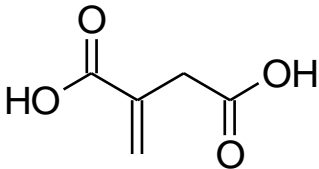

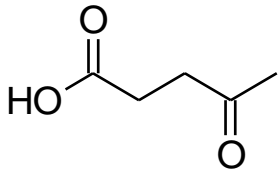

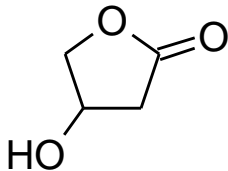

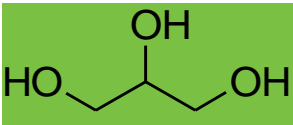

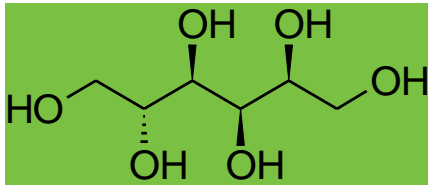

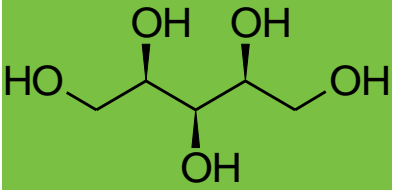

Strategic Options

- Data from modeled nth plant cellulosic ethanol NREL Design Case (Humbird, 2011) transposed to generating hydrocarbon fuels using “same” technologies but accounting for 50% loss of feedstock

1. Even if same technology breakthroughs were achieved for hydrocarbon fuel from biochem processing, we will miss our \$3/GGE goal
2. Strategy *must* include:
 - A. Non-fuel products, which are *enriched in oxygen* from biomass
 - or -
 - B. Shrink the conversion costs to < \$1.00
 - or -
 - C. Derive higher value from lignin
 - or –
 - D. Better use of feedstocks

Commoditization Benefits

1. Density and Stability

1. Infrastructure Compatible
(16 lbs/ft³ in field to >48 lbs/ft³ in supply system)
2. Long-term stability in supply system (years, like grain or coal)

2. Conversion Performance

Other Opportunities: Energy Efficiency Innovation

Renewable Materials: Energy Efficiency Impact

Cars are heavy!
(each car weighs 4,000 lbs)

**Reducing vehicle weight by 10%
will result in a 4-5% reduction in
fuel use in passenger cars**

(Pagerit et al., 2006. Fuel Economy Sensitivity to Vehicle Mass for Advanced Vehicle Powertrains. Society of Automotive Engineers. 2006-01-0665)

**Carbon fiber has the highest
strength to weight ratio (super
light weight material)**

**Assuming 8.8 million barrels of oil
consumption by passenger cars
per day, a 10% weight reduction
will results in an annual saving of
~ 5 billion gallons of gasoline in
the United States alone**
